# RPA Practice Challenge 2

Enter this link https://www.gob.pe/busquedas

The search term should be retrieved from an environment variable, the default value should be "Peru". Enter the search term in the search bar and make the corresponding actions to start the search.

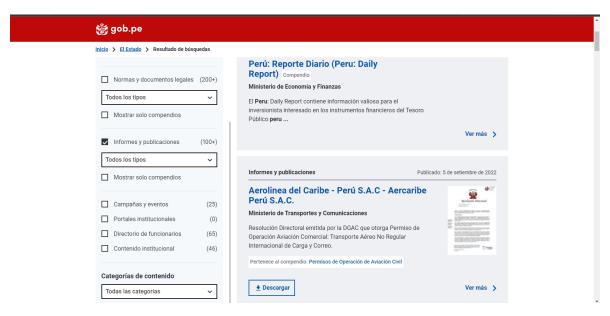

Add filters to only show the results from a date range, the start and end date of this range should be set as separate environment variables, the default value for the start one should be January 1 2022 and the default value for the end one should be March 1 2022. Remember the tip given in the previous challenge.
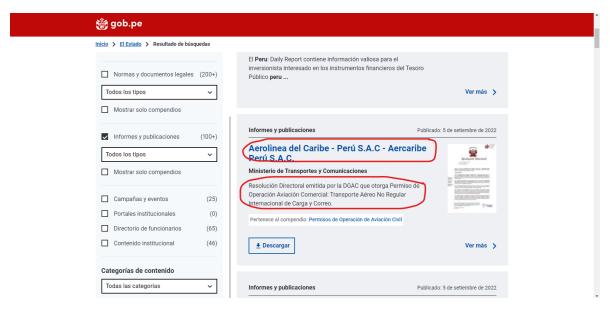

Mark "Informes y publicaciones" as a filter in the side bar.

From the results, get the first 5 results that have a download button and download those 5 files. Have in mind that not all the results will have a download button.

After getting all the files, create a new Excel file called "Files.xlsx". Populate this file with the title of the result, description of the result and the name of the file you downloaded for each of the results you got from the previous step.

Your solution should work both locally and in Robocloud.
